DIATOMS FROM NORTH-EAST GREENLAND

(N. OF 76° N. LAT.)

COLLECTED BY THE "DANMARK-EXPEDITION"

DETERMINED

BY

ERNST ØSTRUP

1910

The material on which the present work is based was given to me for investigation by the Commission for the "Danmark-Expedition."

The saltwater material consisted of (1) 13 samples of *Algæ*, as follows: —

Off Cape Amélie, 5 samples, preserved in glass vessels. The locality given in the text as "Off Cape Amélie."

Danmarks Havn, 3 samples, of which two are herbarium-material, and one in a glass vessel. The locality given in the text as "Danmarks Havn."

Along the peninsula, Cape Bismarck, 1 sample in a glass vessel. The locality in the text given as "Off Cape Bismarck."

Koldewey Ø, 4 samples, of which three are herbarium-material, and one in a glass vessel. The locality given in the text as "Koldewey Isl."

and (2) A series of samples from ice, all preserved in glass vessels, 6 in all, as follows: —

76°20 N. lat., 18°20 W. long., land-ice off Germania Land, 1 sample. Given in the text as "Land-Ice."

75°14 N. lat., 4°34 W. long. The outer edge of the pack-ice, 4 samples. Given in the text as "Margin of the Pack-Ice."

75°14 N. Lat., 11°15 W. long., pack-ice, 1 sample. Given in the text as "Pack-Ice."

The freshwater samples are the same as those given to Dr. F. BÖRGESEN for investigation of the freshwater algae. There are in all 30 samples, partly preserved in glass vessels, and partly dried, in paper bags, but several of them contained such small quantities of material that it proved impossible to obtain serviceable preparations from the uncleansed material, let alone to submit it to a chemical cleansing! The freshwater samples are distributed among the different localities (the names of which are given unaltered in the text) as follows: —

Mallemukfjeld 1 sample: some pebbles.
Hvalrosodde 5 samples, of which 4 in glass vessels, 1 dried material.
Dove Bugt 1 sample, dried powder.
Lille Snæs 3 samples, of which 2 in glass vessels, 1: stone.
Snæs 1 sample in a glass vessel.
Stormbugt 1 sample: two bones.
Stormkap 1 sample, dried material.
Danmarks Havn 2 samples in glass vessels.
Yderbugten 1 sample, dried material.
Vester Elv 7 samples, all in glass vessels.
Basiskærret 1 sample in a glass vessel.
Thermometerfjeld	... 3 samples, of which 2 dried material, 1: stone.
Cape Bismarck 1 sample in a glass vessel.
Nostoc 1 sample, dried material.
Without locality 1 sample in a glass vessel.

As regards the distribution of the Diatoms collected by the "Danmark Expedition," I have, in the present work, exclusively considered the distribution within the Arctic region, and then I have used the following method: —

In regard to the **marine forms**: —

W. Greenl.	denotes a form found along the coasts of West Greenland.
E. Greenl.	— a form found along the coasts of East Greenland.
Greenl.	— a form found along the coasts of both East and West Greenland.
E. of Greenl.	— a form found by Ryder's Expedition on the ice or in plankton, and included in my Mar. D. f. Østg.
East Arct. S.	— a form found in one of the other eastern Arctic Seas as far as the Strait of Behring.

In regard to the **freshwater forms**: —

W. Greenl.	denotes West Greenland.
E. Greenl.	— East Greenland.
Fz. Js. Ld.	— Franz-Josef Land.
Spb.	— Spitzbergen.
B. El.	— Beeren Eiland.
J. M.	— Jan Mayen.

Valva lanceolata-elliptica, apicibus brevissime subrostratis. Raphe area hyalina angustissima, distincta autem, cincta. Striis parallelis, apices versus subradiantibus et, quoad perspicere potui, altera in parte media valvæ deficiensibus ibique fasciam unilateralem male definitam relinquentibus.

Loc. Marg. of the Pack-Ice.

Arct. Distr. E. of Greenl.

I had previously given this species as Nav. Rostellum W. Sm., which Cleve (Syn., II, 4) refers to Nav. Placenta Ehr. If, however, Nav. Rostellum should prove to be identical with Nav. Placenta then the present species cannot be Nav. Rostell., because it has not got the characteristic decussate striation of Nav. Placenta. As I have not been able to see any punctuation of the striae I place it, but with hesitation, under *Navicula orthostichæ* and as perhaps most nearly allied to *Nav. kryokonites* Cl.

The present form is identical with the fig. 31, quoted above, in my Mar. D. Ostg. As I have there pointed out, my specimens as well as the present form, differ from Grunow's figure of a specimen from Fz. Js. L., in that the striae at the apices are not radiate, but almost parallel. As the striae, however, are seen only with great difficulty I think my determination may be correct.

Naviculæ lineolatæ Cl., 1895.

Navicula jamalinensis Cl., var. *subcircularis* var. nova. Tab. nост XIII, fig. 2.

Long. $35\ \mu$. Lat. $24\ \mu$. Str. 7—8 in $10\ \mu$, sub apices 10 in $10\ \mu$, distincte transverse lineatis.

Valva elliptica fere subcirculari. Raphe area hyalina, satis augusta, cincta. Striis radiantibus. Nodulis terminalibus extremis in apicibus situatis.

Loc. Danmarks Havn (Algæ).

This form may be a variety of *Nav. Jamal.* (cf. Cl. Syn., II, 38; Cl. Grun. A. D., Tab. II, fig. 40). It differs from the main species by its almost circular outline and by its apical area being much narrower and more linear than in *Nav. Jamal.*

Navicula jejuna A. Sch., var. *arctica* var. nova. Tab. nост XIII, fig. 5.

Long $68\ \mu$. Lat. $8.5\ \mu$. Str. 8 in $10\ \mu$, obscure punctatis.

Valva linearis, apices versus leniter attenuata. Striis radiantibus, uno in latere valvæ raphen non attingentibus. Raphe sub apices sinuosa.

Loc. Marg. of the Pack-Ice.

This form has some resemblance to *Navicula jejunoidea* H. O. H. (Belgica Exp., II, Tab. I, fig. 12) but its striae are radiate throughout, and are equally distant upon both sides of the raphe.

The habitat of *Nav. jejunoidea*, according to H. Van Heurck (l. e.), is "Glace de banquise No. 141; assez frequent."

Valva elliptica, area apicali distincta. Costis leniter radiantibus, in Hypotheca vitta submarginali nuda interruptis.

Loc. Koldewey Isl. (Algæ).

This species may be Gregory's *Cocc. ornata*, although Gregory (l. c.) describes the apical area as a "long lanceolate blank space" and figures the striæ as strongly radiate towards the apices. Cleve (Syn. II, 171) mentions *Cocc. ornata* as a form which possibly may be a variety of *Cocc. Scutellum* Ehr., but in this matter I cannot agree with him. *Cocconeis ornata* occurs in "Lamlash Bay" and in "Loch Fine."

Valva elliptica. Striis perdifficiliter perspiciendis.

Loc. Koldewey Isl. (2 sampl.).

This hyaline and exceedingly small species may be identical with *Navicula debilissima* Grun. Grunow's figure shows both the terminal nodules and a central nodule and the latter he describes in the text (l. c.) as "minu-

tissimo." As to the present specimens the matter stands as follows: — On all my specimens I have seen a median apical line (a "raphe" or an "apical area"), on some specimens I have observed the terminal nodules a little remote from the apices. On a few specimens I think I have seen a trace of a central nodule, but I am not quite sure of it and therefore I have not put a central nodule in my figures. On the other hand I have been able in some specimens to see a striation at right-angles to the apical axis. A specimen in zone-view, which I had the good fortune to observe showed the frustule bent along the transapical axis after the manner of an *Achnanthes*, but I have not been able to see the frustules united into a band, on the contrary I think I observed them attached separately to the narrow branches of other Algae after the manner of a *Cocconeis*.

***Achnanthes rhombica* sp. nova.** Tab. nost. XIII, fig. 18.

Long. 34μ . Lat. 12μ . Str. 11 in 10μ , utrisqve in valvis, transverse lineatis.

Valva elongate-rhombica. Epitheca: Striis parallelis, area apicali distincta.

Hypothece: Striis valde radiantibus, mediis aliquantum spatiatis.

Raphe area hyalina, media in parte valvæ in aream conspicuum rotundatam dilatata, cincta.

Loc. Off Cape Amélie (Algae).

The epitheca of this species resembles that of *Ach. Lorenziana* Grun., but is somewhat more closely striated. As I have seen both valves in situ I am quite certain that the present species cannot be *Achn. Lorenz.* in which the number of striae on the hypotheca is stated to be 18—27 in 10μ (cf. Cl. Syn., II, 187).

***Achnanthes septentrionalis* sp. nov.** Tab. nost. XIII, fig. 21.

Long. 19μ . Lat. 9μ . Str. 11 in 10μ utrisqve in valvis, transverse lineatis.

Valva lanceolata, apicibus subrostratis. Epitheca: Striis parallelis, area apicali distincta. Hypothece: Striis radiantibus, media in parte valvæ aliquantum spatiatis. Raphe area hyalina, media in valva in aream rotundatam dilatata, cincta.

In the above list I have given an account of the distribution of the individual species within different districts of the Arctic Seas.

I have in all 182 marine forms, of which 24 have until now been unrecorded from the Arctic Seas. Hence 158 (86.8 %), therefore by far the greater part, have previously been recorded from these districts. If we now investigate the more detailed distribution, the result will be as follows: —

- (1) From W. Greenl. are known 103 (56.6 %)
- E. Greenl. + E. of Greenl. are known 120 (66.0 %)
- East Arct. S. are known 125 (68.7 %)

- (2) From W. Greenl. only, and from nowhere else
 in the Arctic districts..... 10 (5.5 %)
 — E. Greenl. + E. of Greenl. only, and from
 nowhere else in the Arctic districts.. 15 (8.2 %)
 — East Arct. S. only, and from nowhere
 else in the Arctic districts 19 (10.4 %)
- (3) From W. Greenl. + E. Greenl..... 53 (29.1 %)
 — W. Greenl. + Eastward 90 (49.5 %)
 — Eastward on the whole 149 (81.9 %)

These three percentage tables show, that there is a rise in the percentages as regards the eastern districts, and therefore the Diatoms found in the material at hand indicate an easterly tendency as regards their Arctic distribution.

As the material examined consists partly of Alga-samples, partly of ice-samples, I have in the following table given an account of the occurrence of the genera in these samples.

Predominant in the Alga-samples are the genera	Number of species and varieties	Predominant in the ice-samples are the genera	Number of species and varieties	In both Alga- and ice-samples occur the genera	Number of species and varieties	In Alga-samp.	In ice-samp.	Both in Alga- and ice-samp.

The above table shows that the following is the distribution in the samples of the 37 genera which occur — 19 (51.4 %) in Alga- and ice-samples, 12 (32.4 %) both in Alga- and ice-samples, and 6 (16.2 %) in ice-samples.

With regard to the species and varieties we find the proportions to be as follows: —

In the Alga-samples are found	129 (70.9 %)
In the ice-samples are found.....	45 (24.7 %)
Both in the Alga- and ice-samples are found	8 (4.4 %)

All the figures were drawn magnified 1000 times by the author, and then photographically reduced to a magnification of 660.

This form, of which I have given a figure, differs in the striation, which in the main species is radiate, but here is radiate only in the middle and parallel towards the apices. Lagerstedt has not shown the striation in his fig. 7 a¹, but with regard to the outline and general appearance his figure agrees very well with the present form. Therefore I have no doubt that the present form is identical with *Nav. gibb. capitata* Lgst.

Loc. Off Cape Amélie (Algæ). Only a single specimen met with.

Judging from its appearance as a whole this form may be a freshwater-species, although it occurred in a sample of marine Algæ.

Anomoeoneis Zellensis var. *linearis* Øst., var. nova. Tab. XIV, fig. 6.

Long. 22μ . Lat. 4μ . Striis inconspicuis.

Valva linearis, apicibus leniter attenuatis. Raphe area hyalina angusta media in valva in aream transapicalem parvam rotundatam dilatata, cincta. Structura valvae sicut seabraosa, an elevationes apicales laterales ostendente? Nodulis terminalibus inconspicuis.

Loc. Hvalrosodde (2 sampl.).

This small form recalls in its structure that of *Anomoeoneis Zell.*, but in outline it recalls *Navicula difficilis* Grun. (V. H. Syn., Tab. XII, fig. 17) a species which perhaps may belong to the genus *Anomoeoneis*.

Cocconeis flexella Kütz. var. *intermedia* var. *nova*. Tab. nost XIV, fig. 12.

Long. 38μ . Lat. 14μ . Str. media in valva 22 in 10μ , apices versus densioribus.

Epitheca: Area centrali subquadrata, satis magna.

Hypotheca: Raphe sigmoidea, area angusta hyalina, media in parte valvæ in aream centralem acuminatam dilatata, cineta.

Loc. Hvalrosodde.

Especially on account of the subquadrate area of the epitheca I think this form may be intermediate between *Coccon. flex.* and *Coccon. maxima forma minor*. As I have not seen the epitheca and the hypotheca separated, but only in situ I have indicated in my figure of the hypotheca the extent of the central area of the epitheca.

Cocconeis maxima (A. Cl.) Øst. *forma minor*, cf. A. Cl., Lul. Lappm., 24, Tab. I, figs. 22—23 (Achnanthid. maxim. A. Cl.).

Loc. Hvalrosodde.

A. Cleve states that the length of *Achnanthidium maximum* is 0.065 mm (an epitheca) and 0.075 mm (a hypotheca) and she says (l. c.) "Though not seen together, the two valves described above, found in the same sample, certainly belong to the same species."

On an average my specimens are somewhat smaller (Length 48—56 μ , only one specimen measures 60 μ), but otherwise they agree well with A. Cleve's figures.

As I have seen both valves in situ I can affirm that they are corresponding valves.

Cocconeis maxima var. *lanceolata* var. nova. Tab. nost XIV, fig. 14.

Long. 74 μ . Lat. 22 μ . Str., media in valva, 16—17 in 10 μ , apices versus densioribus.

Valva rhombice-lanceolata, apicibus rotundatis. Epitheca: Area centrali quadrata magna. Hypotheca: Raphe sigmoidea, area hyalina angustissima, media in parte valvæ in aream parvam subcircularem dilatata, cincta. Striis radiantibus. Nodulis terminalibus, paululum a margine remotis, in spatio laterali nudo situatis.

Loc. Hvalrosodde.

As in the figure of *Cocc. flex. interm.*, so also here, I have indicated the extent of the central area of the epitheca as I have only seen both valves in situ.

Valva margine dorsali curvata margine ventrali recta, apicibus rotundatis, marginem ventralem versus leniter incurvatis.

Loc. Off Cape Amélie (Algæ). Only a single specimen found.

The present variety differs from the main species especially by its irregularly arranged striae. Otherwise it agrees well with the figure by Héri-baud referred to above, but is somewhat smaller. It may perhaps be considered as only an abnormal specimen of the main species, which is a fossil recorded from "Dépot de Fraisse-Bas" (France).

									Total ..	44	74	38	46	16	28

The above list shows, that the total number of freshwater forms is 128, and of these there were previously known

from W. Greenland 44 (34.1 %)
 — E. Greenland 74 (57.4 %)
 — Franz-Josef Land 38 (29.5 %)

from Spitzbergen	46 (35.7 %)
— Beeren Eiland	16 (12.4 %)
— Jan Mayen	28 (21.7 %)
not recorded	28 (21.7 %),
hence previously known from the Arctic regions	101 (78.3 %).
From W. Greenl. only, and from no other Arctic locality	11 (8.5 %).
From the localities east of E. Greenl., taken as a whole	76 (58.9 %).

This proves that the freshwater-Diatom-flora from East Greenland which we are here considering obviously originates from the east, and as regards the eastern localities, more particularly from Spitzbergen.

To this may be added that five of the forms which have been found, viz.

- Cymbella affinis tumida*
 — *Botellus*
 — *ventricosa semicircularis*
Navicula gibbula capitata and
 — *Lagerstedtii*,

have hitherto — outside Greenland — been found only in Spitzbergen; and a similar origin is indicated for some of the Desmidiae found by Dr. F. BÖRGESEN (cf. F. Börgesen: Freshw. Algæ, p. 73).
